

Design a Java application to manage vehicle purchase details using **interfaces**. Create two interfaces, **Loan** and **Insurance**, that declare methods to calculate loan EMI and insurance premium.

Develop a `Vehicle` class that implements both interfaces and stores vehicle information such as vehicle number, brand, and price.

The program should allow the user to:

- Add vehicle details
- Calculate loan EMI for a given amount and duration
- Calculate insurance premium based on vehicle price
- Display complete vehicle information

The application must be menu-driven and demonstrate interface implementation and method overriding.

Use EMI Formula:

$$EMI = \frac{P \times R \times (1 + R)^N}{(1 + R)^N - 1}$$

Where:

- P = Principal amount
- R = Monthly interest rate
- N = Number of months

Example:

- Annual interest = 10%
- Monthly rate =  $10 / (12 \times 100)$
